

MIRCHILIME Connect

A guide for the sales team

This document explains what MIRCHILIME Connect is, what you will receive every day, and what to do with it. No technical knowledge needed.

1. What is MIRCHILIME Connect?

MIRCHILIME Connect is a truck tracking platform that shows where all active trucks are at any given time using FASTag toll crossing data. Every time a truck passes through a toll plaza, its location is recorded automatically.

- Tracks all active trucks in real time using FASTag data
- Shows the full route every toll plaza the truck has crossed, in order
- Covers **Live Routes** (long-distance enroute trips)
- Sends a WhatsApp message every day at **11:05 AM** and **7:05 PM** with live tracking links for all enroute trucks

2. What You Receive Every Day

Every day at **11:05 AM** and **7:05 PM**, you will automatically receive one WhatsApp message per active enroute truck. Each message contains the truck number and its individual live tracking link.

Example of what each WhatsApp message looks like:

3. What To Do With It

When you receive the WhatsApp messages, follow these steps:

What the customer sees when they open the link

A simple map showing the truck's current location, the last toll plaza it crossed, and the time of the last update. No login needed - just open the link on any phone or computer.

4. What's Coming Next

Future Plan - Direct messages to Transporter

Currently the WhatsApp tracking links are sent to sales person, who then forwards them to the customer. In the future, the system will send the tracking link directly to the person who required the link.

- Send tracking links directly to the transporter (tranco) phone number
- Auto-notify customers when the truck is near the destination
- Trip completion detection - automatically close a trip when the truck arrives

Note - Trip completion detection is built but not yet active

The system has logic to automatically detect when a truck reaches its destination (within 50 km for 1+ hour). However, it is currently not working because Zoho is not sending the destination pincode (drop_pincode) for enroute trips - so the system has no destination to compare against. This is a data issue in Zoho, not a system problem. Once Zoho fills in the destination pincode for each trip, this feature will activate automatically.
